

Cost & latency metrics — dev validation (2026-04-15)

Change under development on branch `chore/sc-42991/create-cost-and-time-scorers`. Cost and latency are now logged as Braintrust **span metrics** (not scorers). The earlier scorer-based approach failed because Braintrust scores must be in $[0,1]$ — the latency scorer threw on every row.

Metric	Coverage	Min	Median	Avg	Max	Total
cost_usd	88 / 88	\$0.0024	\$0.124	\$0.109	\$0.274	\$9.62
latency_seconds	88 / 88	1.32 s	30.11 s	28.99 s	69.29 s	—

Validated in run *Automated Eval - 2026-04-15 14:50-6e1cf278* against `localhost:8001`, commit `05b1f4a`. 88/88 task rows carry both metrics. Zero task errors, zero auth errors. `Experiment-level errors` metric dropped from 1.00 (prior run, where the old latency scorer failed every row) to 0.08 (just transient Braintrust infra timeouts, all retried).
